C. --- SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE DIFFERENT POLYPEPTIDE CHAINS (ALPHA, BETA, GAMAA), WHICH ARE BOUND TO EACH OTHER BY DISCULTIDE BONDS INTO A CROSS-SHAPED MOLECULE. COMPRISING ONE LONG THREE SHORT ARMS WITH GLOBULES AT EACH END.

THE BETA-2 CHAIN IS A SUBUNIT OF LAMININ-3 (S-LAMININ), LAMININ-4 (S-MEROSIN), AND LAMININ-7 (KS-LAMININ).

C. --- SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT).

C. --- DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS I OF FORM A COILED COIL STRUCTURE.

WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.

C. --- DOMAIN: DOMAINS VI AND IV ARE GLOBULAR.

C. --- SIMILARITY: CONTAINS 12.5 LAMININ EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. CD40L RECEPTOR PRECURSOR (B-CELL SURFACE ANTIGEN CD40) (BP50) (CDW40).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Genomic structure and chromosomal mapping of the murine CD40 gene."; J. Immunol. 149:3921-3926(1992).
-i- FUNCTION: RECEPTOR FOR A CYTOKINE LIGAND KNOWN AS CD40L.
-i- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-i- SUBCELLULAR: CONTAINS A LA-NGFR/TNFR-TYPE CYSTEINE-RICH REGION.
                                                                                                                                                                                                                                                                                                   56 TCRHHPCPPGQGVQSQGKFSFGFQCIDCASGTFSGGHEGHCKPWTDCTQFGFLTVFPGNK 115

Eur. J. Immunol. 25:926-930(1995).
-I- FUNCTION: RECEPTOR FOR THE OX40L/GP34 CYTOKINE.
-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-I- SIMILARITY: CONTAINS A LA-NGFR/TNFR-TYPE CYSTEINE-RICH REGION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pfam; PF00020; TNFR_c6; 3.

A; Description: catalyzes hydrolysis of 1,2-diacyl-sn-glycero-3-phosphocholine to 1-ac A; Note: the reaction is strongly enhanced when the phospholipid is condensed into a m C; Superfamily: phospholipase A2
C; Superfamily: phospholipase A2
C; Keywords: calcium; carboxylic ester hydrolase; lipid degradation; metalloprotein; m F; 4,67/Binding site: micellar substrate (Gin, Tyr) #status predicted F; 11-71,27-118,29-45,44-99; 51-92,60-85,78-90/Disulfide bonds: #status predicted F; 28,30,32,49/Binding site: calcium (Tyr, Gly, Gly, Asp) #status predicted F; 93/Active site: His #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A; Title: Tryptophan 110, a residue involved in the toxic activity but not in the enzy A; Reference number: $06655; MuID:90060109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A; Molecule type: protein A; Molecule type: protein A; Residues: 1-17, X', 19-24; 96-112 < MOL>
A; Residues: 1-17, X', 19-24; 96-112 < MOL>
A; Note: chemical modification shows that Trp-110 is required for toxin activity, but R; Yang, C.C.; Chang, L.S.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Amino acid sequences of phospholipases A-2 from the venom of an Austricence number: A94319; MUID:85193286

A; Accession: A00748 A; Molecule type: protein A; Residues: 1-118 <NIS>

A; Residues: 1-118 <NIS> C; Comment: There are many protein components with phospholipase A2 activity in the mu C; Function:

A; Description: catalyzes hydrolysis of 1,2-diacyl-sn-glycero-3-phosphocholine to 1-ac A; Note: the reaction is strongly enhanced when the phospholipid is condensed into a m C; Superfamily: phospholipase A2 C; Keywords: calcium; carboxylic ester hydrolase; lipid degradation; metalloprotein; p F; 4, 5/Fbinding site: micellar substrate (Gln, Tyr) #status predicted F; 28, 30, 32, 49, 49+98, 51-91, 60-84, 78+98/pisulfide bonds: #status predicted F; 28, 30, 32, 49/Binding site: calcium (Tyr, Gly, Gly, Asp) #status predicted F; 48, 92/Active site: His, Asp #status predicted

-!- FUNCTION: THE KERATIN PRODUCTS OF MAMMALIAN EPIDERMAL DERIVATIVES
SUCH AS WOOL AND HAIR CONSIST OF MICROFIBRILS EMBEDDED IN A RIGID
MATRIX OF OFTHER PROTEINS. THE MATRIX PROTEINS INCLUDE THE HIGH-
SULFUR AND HIGH-TYROSINE KERATINS, HAVING MOLECULAR WEIGHTS OF
6-20 KDA, WHEREAS THE MICROFIBRILS CONTAIN THE LARGER, LOW-SULFUR
KERATINS (40-56 KDA).

**Eur. J. Biochem. 128:11-75(1982)."

-I- FUNCTION: TAIPOXIN IS THE MOST POTENT ANIMAL TOXIN KNOWN.

THE BETA CHAIN IS NEITHER TOXIC NOR ENZYMATICALLY ACTIVE BY ITSELF. IT DOES NOT BIND CALCIUM.

-I- SUBUNIT: CONTAINS THREE NONCOVALENTLY BOUND CHAINS (ALPHA, BETA, AND GAMMA), BACH RELATED TO PHOSPHOLIPASE A2.

-I- SIMILARITY: BELONGS TO THE PHOSPHOLIPASE A2.

PIR: A00755; PSOXB.

Taustralian king brown snake, Pseudechis australis.";

Taustralian king brown snake, Pseudechis australis.";

TATALYIC ACTIVITY: PHOSPHOLIUME + H(2)O = 1-ACYLGLYCERYL-CCC - CATALYIC ACTIVITY: PHOSPHOGLYCERIDES.

C. - CATALYIC ACTIVITY: PHOSPHOLINE + H(2)O = 1-ACYLGLYCERYL-CCC - PHOSPHOLINE + A FATTY ACID ANION.

C. - MISCELLANEOUS: THERE ARE MANY PROTEIN COMPONENTS WITH PHOSPHOLIPASE A ACTIVITY IN THE WULGA SNAKE VENOM AND SOME OF THEM ARE MYOTOXIC.

C. - SIMILARITY: BELONGS TO THE PHOSPHOLIPASE A FAMILY.

C. - SIMILARITY: PROOBS : PHPHLIPASEA 2.
